BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

                                                                                                                                                                                                                                                                                                                                                         ö
                                                                         This invention describes the isolation of a novel human B1 protein which can interact with, intracellular mediators or modulators of inflammation, cell death and/or cell survival pathways, directly or indirectly. Cells can be modulated or mediated in inflammation, cell death or cell survival pathways or another intracellular signalling activity using B1. Conditions such as AIDS and cancer can be treated using B1. Antibodies, oligonucleotides and ribozymes can also be used to regulate the above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180

                                                                Y68769-95 and Y68797-99 represent human phosphorylation effectors (PHSP designated PHSP1-PHSP31 (the protein Sequence for PHSP28 is not given in the specification). The sequences were isolated from cDNA ilbraries prepared from various human tissues. The PHSP proteins are useful for the diagnosis, treatment and prevention of proliferative disorders, fimmune disorders and neuronal disorders. The PHSP proteins form pharmaceutical compositions which useful for treating or preventing disorders associated with decreased PHSP expression/activity. PHSP antagonists are useful for treating or preventing disorders associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SKSAPEGGTIIYMPPENYEPGQKSRASIKHDIYSYAVITWEVLSRKQPFEDVTNPLQIMY 240

C77607 to C78448 encode the human cancer associated proteins given in 843398 to B44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: Cytostatic; proliferative, vulnerary; immunomodulator; antidiabetic; antisthmatic; antistlammatory; antiallammatory; antiallammatory; antiallammatory; antiallammatory; antithyroid; antiallargic; antibacterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coagulant; nootroplic; antipsoriatic and antiangiogenic. The polynucleotides and polyneptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haemacopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in the exemplification of the present
                 dermatological; neuroprotective; thrombolytic; coagulant; nootropic; vasctropic; antipsoriatic; antiangiogenic; gene therapy; inflammation; immune disorder; haematopoletic cell disorder; autoimmune disorder; allergic reaction; graft versus host disease; organ rejection; haemostatic; thrombolytic; cardiovascular disorder; infection; neurological disease; drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120

This invention describes the isolation of moves in a proteins and a partial murine CARD-12 and CARD-4 polynucleotides and proteins of partial murine CARD-14 protein and genes. The genes and proteins of partial murine CARD-14 protein and genes. The genes and proteins of the invention are involved in the regulation of caspase activation.

The caspase recruitment domain (CARD) polynucleotides, polypeptides, homologues and antibodies can be used in screening assays, detection assays, predictive medicine and therapeutic and probpylactic methods of treatment. The methods may be used to diagnose and treat patients which are suffering from a disorder associated with abnormal level or rate of complex, abnormal activity of the Fas/APO-1 receptor complex, abnormal activity of the Fas/APO-1 receptor complex, abnormal activity of the rank may be treated include cancer complex, abnormal activity of the caspase. Diseases that may be treated include cancer complex, and bormone-dependent tumours), autoimmune disorders (e.g. systemic lupus erythematosis, immune-mediated glomerulonephritis), viral in p53 and hormone-dependent tumours), autoimmune disorders (e.g. systemic lupus erythematosis, immune-mediated glomerulonephritis), viral infections, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, spinal muscular dystrophy, cerebellar celegeneration, anaemia, myelodysplastic syndrome, myocardial infarction, and stroke. CARD-3 protein interacts with other cellular proteins, and so can be used for regulation of cellular proliferation and differentiation and cell survival. The CARD proteins may also be used to for screen drugs or compounds which modulate their activity. The CARD-4F gene can express a long transcript that encodes CARD-4F, and CARD-4Z. This sequence control of the human CARD-4 and CARD-4Z. This sequence represents the human CARD-3 protein described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      540

This sequence is the human RICK (RIP-like interacting CLARP kinase)
protein of the invention. The RICK protein acts as a positive regulator
of apoptosis, potentiating apoptosis induced by caspase-8 and caspase-10
during CD95 signalling. The invention provides methods for identifying
apoptosis signalling pathway inhibitors and activators, and methods and
compositions for screening compounds which will modulate the interactions
of the various compositions identified: ARC, RICK, and the CIDE family of
activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening
confositions for agents, useful in the diagnosis, prognosis or treatment of
disease associated with excess cell growth and dysregulation of
conpositions complexes containing RICK and CLARP can be used in drug
screening assays to identify inhibitor molecules blocking CD95-mediated
confositions of the enzymantic activity of caspase-8.
Confosition of ARC-like inhibitory compounds may be useful for gene
therapy treatment of disease with increased cell death in muscole tissue
and cardiac disorders. Therapeutic compositions of CIDEs can be used
confosition as reagents for the preparation or affinity chromatography
media, and for diagnostically measuring RICK levels: A specific inhibitor
confosition with intracellular factors such as cLARP and FADD appears to
confosition for appoptosis, inhibitors of RICK binding to intracellular
confosition as CLARP and FADD appears to
confosition for appoptosis, inhibitors of RICK binding to intracellular
confosition and for diagnostically decreased as reagents and protein as CLARP and FADD appears to
confosition for appoptosis, inhibitors of RICK binding to intracellular
confosition and for diagnostically decreased as reagents and protein as CLARP and FADD appears to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       caspase-8; caspase-10; CD95 signalling; apoptosis signalling pathway; CIDE-A; CIDE-B; DREP-1; diagnosis; cell growth; apoptosis dysregulation; gene therapy; cardiac disorder; cancer; neurodegenerative disorder; AIDS; aplastic anaemia; ischaemic injury; toxin-induced liver disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human; RIP-like interacting CLARP kinase; apoptosis regulator; ARC;

Human RICK protein sequence residues 248-531.

21-MAR-2000 (first entry)

```
This sequence is a fragment of the human RICK (RIP-like interacting CLARP Kinase) protein of the invention. RICK acts as a positive regulator of apoptosis, potentialing apoptosis induced by caspase-8 and caspase-10 during CD95 signalling. The invention provides methods for identifying apoptosis signalling pathway inhibitors and activators, and methods and compositions for screening compositions identified: RCK, RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening compositions identified: RCK, RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening compositions identified: RCK is useful in screening compositions identified: RCK is useful in screening apoptosis. Complexes containing RICK and CLARP can be used in drug screening assays to identify inhibitor molecules blocking CD95-mediated apoptosis. Overexpression of ARC in an in vitro cell system can be used conformation of ARC-1 ke inhibitory compounds may be useful for gene therapy treatment of disease with increased cell death in muscle tissue and cardiac disorders. Therapeutic compositions of CIDEs can be used to therapy treatment of disease with increased cell death in muscle tissue and cardiac disorders. Therapeutic compositions of CIDEs can be used to treat e.g. cancer, AIDS, neurodegenerative disease. AntiRICK antibodies can be used as reagents for the preparation or affinity chromatography median in the intracellular factors such as CLARP and FADD appears to be essential step in the blochemistry of apoptosis is needed. RICK interaction with intracellular factors such as CLARP and FADD appears to be essential factors are potential drug candidates.

Con be essential factors are potential drug candidates.

Con poptosis factors are potential drug candidates.

```
This sequence is a fragment of the human RICK (RIP-like interacting CLARP Kinase) protein of the invention. RICK acts as a positive regulator of apoptosis, potentialing apoptosis induced by caspase-8 and caspase-10 during CD95 signalling. The invention provides methods for identifying apoptosis signalling pathway inhibitors and activators, and methods and compositions for screening compounds which will modulate the interactions of the various compositions identified: ACK, RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening assays for agents, useful in the diagnosis, prognosis or treatment of disease associated with excess cell growth and dysregulation of apoptosis. Complexes containing RICK and CLARP can be used in drug screening assays to identify inhibitor molecules blocking CD95-mediated apoptosis. Owexpression of ARC in an in vitro cell system can be used to identify inhibitors of the enzymatic activity of caspase-8.

C identification of ARC-like inhibitory compounds may be useful for gene therapy treatment of disease with increased cell death in muscle tissue and cardiac disorders. Therapeutic compositions of CIDEs can be used to treat e.g. cancer, AIDS, neurodegenerative disorders, aplastic anaemia, ischaemic injury, and toxin-induced liver disease. AntirRICK antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequences F21614 - F22031 represent DNA sequences encoding human proteins
can be used as reagents for the preparation or affinity chromatography media, and for diagnostically measuring RICK levels. A specific inhibitor of an essential step in the biochemistry of apoptosis is needed. RICK interaction with intracellular factors such as CLARP and FADD appears to be essential for apoptosis, inhibitors of RICK binding to intracellular apoptosis factors are potential drug candidates.

Note: This sequence was created using information given in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; breast cancer; ovarian cancer; cytostatic; immunosuppressive; nootropic; neurpprotective; antiviral; antiallergic; hepatotropic; antidabetic; antinifammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; immune disorder; Addison's disease; allergy; autoimmune haemolytic anaemia; autoimmune thytoiditis; diabetes mellitus; Crohn's disease; multiple sclerosis; rheumatoid arthritis; ulcerative collitis; cardiovascular disorder; wound healing; neurological disease.

breast and ovarian cancer. Included in the invention are sequences breast and ovarian cancer. Included in the invention are sequences (#22012 - #22014) which are used in the isolation are sequences characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; Immunosuppressive, nootropic; antidiabetic; antihiflammatory; antiulcer; ununerary; anticonvulsant; antidiabetic; antihiflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antihiflammatory antiulcer; vulnerary; anticonvulsant; antibacterial; and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune chyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatorid arthritis and ulcerarive colitis; cardiovascular disorders such as anyocardial ischaemias; wound healing; neurological diseases such as cerebral anoxia and epilepsy; and

The present sequence represents a murine death associated kinase protein, containing ankyrin repeats, designated DAKAR. The DAKAR polynucleotides containing ankyrin repeats, designated DAKAR. The DAKAR polynucleotides can be used to express the polypeptides, and as probes to identify mucleic acids encoding proteins having kinase activity. DAKAR polypeptides are used for purifying proteins, e.g. to measure protein activity, as quality assurance agents to monitor shelf life and stability of binding partner proteins; as research agents, e.g. in assays to determine protein kinase activity. To identify novel molecules involved in signal transduction pathways, and to identify therapeutic compounds which may interfere with a poptosis; as molecular weight and isoelectric focusing markers; as controls for peptide fragmentation; identification of unknown proteins, e.g. by comparison with proteins in databases; and for preparation of antibodies. The antibodies can be used in assays to detect the presence of the protein, and to purify the protein by immunoaffinity chromatography. The antibodies can also be used to block binding of the protein by and parkar binding partners. Compounds that inhibit or enhance the kinase activity of DAKAR can be used to treat diseases characterized by overproduction or upregulated production of DAKAR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 21;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and half follicle disorders. Sequences V75942-Y76123 represent polypeptides encoded by cDNA sequences Y75942-Y76121 represent polypeptides encoded by cDNA sequences Y75942-Y76121 represent polypeptides and half coll types. Sequences Y75942-Y76121, Y76020-Y76021, Y76019 are proteins with an N-terminal signal sequence, indicating that they are secreted. Sequences Y75986-Y75989, Y76061-Y76071, Y76106-Y76109 and Y76112-Y76122 are proteins with one or more putative transmembrane

The sequence represents translation (reading frame 3) of Genesis clone 971025TRAMON480HT (see 258584). The invention relates to purified murine polypeptides having kinase function (see Y79152-56) and isolated nucleic acids encoding them (see Z58582-86). Claimed vectors comparising the novel nucleic acids, and claimed host cells (bacterial, yeast, plant, insect or animal) transfected or transduced with the vectors, are used to produce the polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel murine polynucleotides encoding kinase polypeptides, used as probes to identify nucleic acids encoding proteins having kinase

The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleocitde can be used as a marker, in the identification of genetic disorders, and for the design of

                                                                                                                                                                                                                                                                                                                                                                                                                       The kinase polypeptides and their fragments are used as mol. wt. and isoelectric focusing markers, and as controls for peptide fragmentation. They also have a number of therapeutic uses, as kinases play a central role in cellular signal transduction. As such, alterations in kinase expression and/or activation can have a profloud effect on a plethora of cellular processes, e.g. proliferation and programmed cell death (apoptosis). The kinase polypeptides could also be used to identify binding partner proteins, or as reagents to identify proteins that regulate or interact with them. They may also be used for preparation of antibodies useful for detection, purification, and for blocking binding of kinase polypeptides to their binding partners.

/clone="Industrian" / clone="Industrian" / clone="Vector: pT713D-Pac (Pharmacia) with a modified / note=="Vector: pT713D-Pac (Pharmacia) with a modified polylinker; Plasmid DNA from the normalized library NCI_CGAP_CG4 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hypridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (clone198 1257096-1258631, 1469064-1470983, and 1475592-1476743); Subtraction by Bento Soares and M. Fatima Bonaldo. "Subtraction by Bento Soares and M. Fatima Bonaldo." CDNA Library Arrayed by: Greg Lennon, Ph.D.
DNA Sequencing by: Washington University Genome Sequencing Center
